# WINDOWS POWERSHELL 101

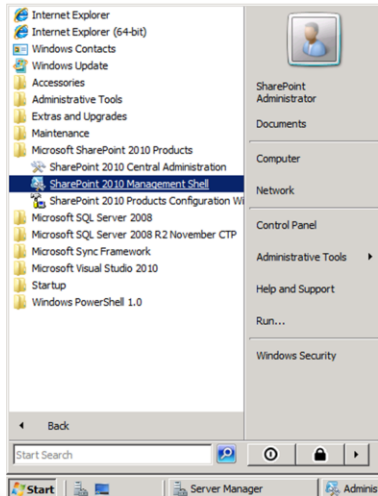

---

Getting on the same page...

BEST PRACTICES CONFERENCE SHAREPOINT ►

# Management Shell

• `C:\Windows\System32\WindowsPowerShell\v1.0\PowerShell.exe -NoExit " & 'C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\14\CONFIG\POWER SHELL\Registration\sharepoint.ps1 ' "`

## Load Snap-in For any Editor

```
1 if (!(Test-Path $profile.AllUsersAllHosts)) {
2   New-Item -Type file -Path $profile.AllUsersAllHosts -Force
3   $sb = @"
4   if (`$host.UI.RawUI.WindowTitle -ne "Administrator: SharePoint 2010 Management Shell") {
5     `$ver = `$host | select version
6     if (`$ver.Version.Major -gt 1) {$host.Runspace.ThreadOptions = "ReuseThread"}
7     if ((Get-PSSnapin "Microsoft.SharePoint.PowerShell" -ErrorAction SilentlyContinue) -eq `$null) {
8       Add-PSSnapin "Microsoft.SharePoint.PowerShell"
9     }
10  }
11  "@
12  Set-Content -Path $profile.AllUsersAllHosts -Value $sb
13 }
```

```
if (!(Test-Path $profile.AllUsersAllHosts)) {
  New-Item -Type file -Path $profile.AllUsersAllHosts -Force
}
$sb = @"
if (`$host.UI.RawUI.WindowTitle -ne "Administrator: SharePoint 2010 Management
Shell") {
  `$ver = `$host | select version
  if (`$ver.Version.Major -gt 1) {$host.Runspace.ThreadOptions = "ReuseThread"}
  if ((Get-PSSnapin "Microsoft.SharePoint.PowerShell" -ErrorAction SilentlyContinue) -
eq `$null) {
    Add-PSSnapin "Microsoft.SharePoint.PowerShell"
  }
}
"@
Set-Content -Path $profile.AllUsersAllHosts -Value $sb
```

## Required Permissions

- Member of WSS\_ADMIN\_WPG and SharePoint\_Shell\_Access
- Use Add-SPShellAdmin to add a user to these groups

```
1 Add-SPShellAdmin -UserName domain\user
2
3 Add-SPShellAdmin -database "SharePoint_Demo_Content1"
4   -UserName domain\user
5
6 Get-SPDatabase | where {
7   $_.Name -like "SharePoint_Demo*"
8 } | Add-SPShellAdmin -UserName domain\user
```

- Some commands require the user to be a local server admin and a Farm admin
- Remove-SPShellAdmin does not remove from WSS\_ADMIN\_WPG!

SharePoint\_Shell\_Access role exists in the config db by default but no other databases. The Add-SPShellAdmin cmdlet will add the user to the WSS\_ADMIN\_WPG group on each server (not just the executing server). The Remove-SPShellAdmin cmdlet does not remove from the WSS\_ADMIN\_WPG group so you must manually remove the user from this group.

To add to the Farm Admin group:

```
New-SPUser -UserAlias "domain\user" -Web "http://sp2010:1234/" -Group "Farm Administrators"
```

# COMMON TASKS - REPORTING

---

Getting things done...

BEST PRACTICES CONFERENCE SHAREPOINT ▶

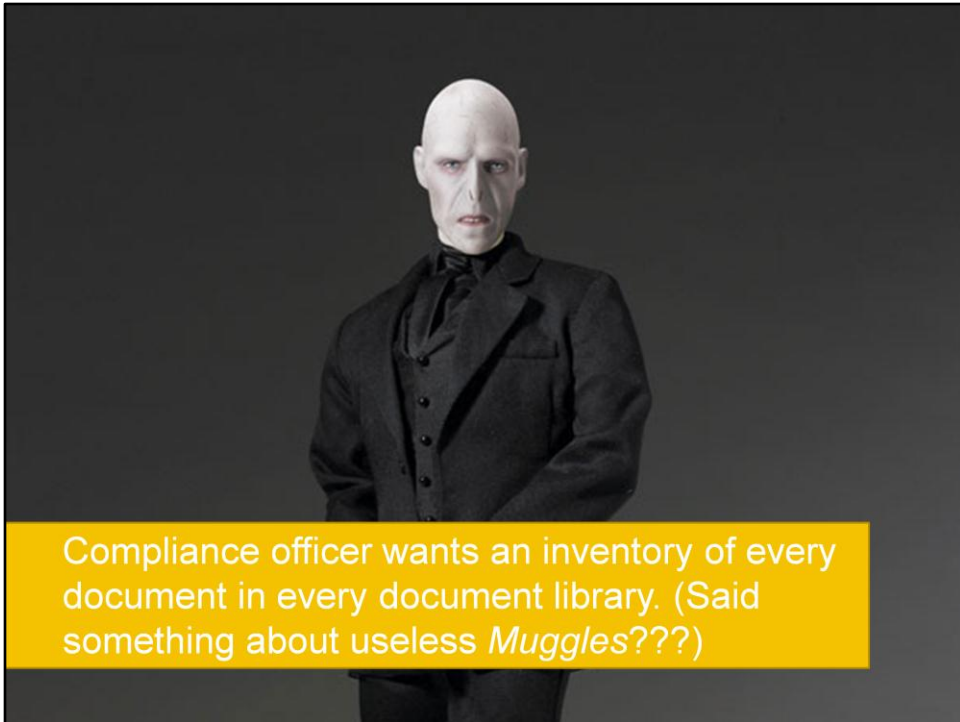

Our Content Databases are filling up with... lots of valuable stuff. How do I find out how big the databases, Site Collections, and Lists are?

```
Get-SPDatabase | select Name,  
@{Expression={$_.DiskSizeRequired/1MB};Label="Size"} | sort Size -Descending
```

```
get-spsite -limit all | select url,  
@{Expression={$_.Usage.Storage/1MB};Label="Size"},@{Expression={$_.AllWebs.Count};Label="Webs"} | sort Size -Descending
```

```
Get-SPWeb -Site http://demo/sites/b20 | % {$_.Lists} | select  
@{Expression={$_.RootFolder.ServerRelativeUrl};Label="Url"},Title,ItemCount | sort  
ItemCount
```

```
function Get-DocInventory() {  
  foreach ($site in (Get-SPSite -Limit All)) {  
    foreach ($web in $site.AllWebs) {  
      foreach ($list in $web.Lists) {  
        if ($list.BaseType -ne "DocumentLibrary") {  
          continue  
        }  
        foreach ($item in $list.Items) {  
          $data = @{  
            "Site" = $site.Url  
            "Web" = $web.Url  
            "list" = $list.Title  
            "Item ID" = $item.ID  
            "Item URL" = $item.Url  
            "Item Title" = $item.Title  
            "Item Created" = $item["Created"]  
            "Item Modified" = $item["Modified"]  
            "File Size" = $item.File.Length/1KB  
          }  
          New-Object PSObject -Property $data  
        }  
      }  
      $web.Dispose();  
    }  
    $site.Dispose()  
  }  
}
```

Get-DocInventory | Out-GridView

#Get-DocInventory | Export-Csv -NoTypeInfoInformation -Path c:\inventory.csv

Get-SPUserEffectivePermissions.ps1

# COMMON TASKS - MAINTENANCE

---

Getting things done...

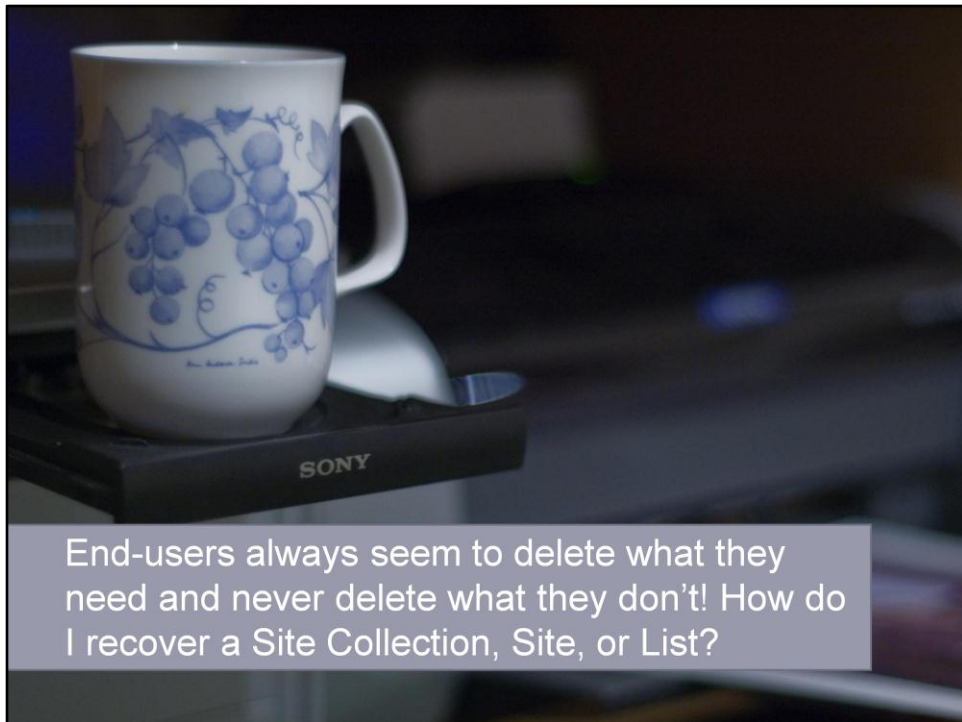

BEST PRACTICES CONFERENCE SHAREPOINT ►

```
Get-SLogEvent -StartTime (Get-Date).AddMinutes(-10) | ? {$_.Correlation -eq "8db5e7ed-075c-46cc-8d7c-e2cb78f15f7e"}
```

```
Merge-SLogFile -Path c:\events.log -StartTime (Get-Date).AddMinutes(-10) -EndTime (Get-Date) -Correlation "e7ed36e1-4966-4f91-b3cc-3951ba4c5e38"
```

End-users always seem to delete what they need and never delete what they don't! How do I recover a Site Collection, Site, or List?

```
$db = Get-SPContentDatabase -ConnectAsUnattachedDatabase -DatabaseName  
"SharePoint_Restore1" -DatabaseServer "spsql1"
```

```
$restoredSite = $db | Get-SPSite | where { $_.ServerRelativeUrl -eq "/sites/bpcuk" }  
Backup-SPSite -Identity $restoredSite -Path C:\backups\Demo.bak -NoSiteLock
```

```
$web = $restoredSite | Get-SPWeb "/sites/bpcuk/ps4admins"  
Export-SPWeb -Identity $web -Path C:\ExportData\PS4Admins -NoFileCompression -  
IncludeVersions All -IncludeUserSecurity
```

```
new-spweb -Url http://demo/sites/bpcuk/PS4Admins -AddToTopNav -Name  
"PowerShell for Administrators"
```

```
import-spweb -Identity http://demo/sites/bpcuk/ps4admins -Path  
C:\ExportData\PS4Admins -NoFileCompression -IncludeUserSecurity
```

```
$user = new-spuser -UserAlias aptillon\glapointe -Web http://demo  
$group = Get-SPGroup -web http://demo -group "Demo Members"  
$group.AddUser($user)
```

```
$group = New-SPGroup -web http://demo -groupName "BPC Group" -ownerName  
aptillon\spadmin -desc "BPC Group" -memberName aptillon\spadmin
```

```
Add-SPGroupPermission -group $group -permissions "Contribute","Design"
```

# WINDOWS POWERSHELL REMOTING

Administering SharePoint remotely...

BEST PRACTICES CONFERENCE SHAREPOINT ▶

## Remoting

- PowerShell Remoting uses WinRM, Microsoft's implementation of the WS-Management protocol
  - WinRM allows you to run scripts against remote servers over HTTP and HTTPS
- Works with V2 only
- Requires that WinRM be enabled on both the client and the server

## Enabling Remoting

- Run `Enable-PsRemoting` on the client and server machines
- Must Enable CredSSP
  - Credential Security Support Provider
  - Allows cmdlets to talk to SQL using the provided credentials (handles the double-hop issue)
- Increase the `MaxMemoryPerShellMB` setting on remote server (default is 150MB)
  - `Set-Item WSMan:\localhost\Shell\MaxMemoryPerShellMB 1000`
- Decrease `MaxShellsPerUser` and `MaxConcurrentUsers` (default is 5)
  - `Set-Item WSMan:\localhost\shell\MaxShellsPerUser 2`
  - `Set-Item WSMan:\localhost\shell\MaxConcurrentUsers 2`

# Enabling CredSSP

## • On the client machine

- Group Policy must be edited to allow credential delegation to the target computer.
- Use gpedit.msc  
Computer Configuration -> Administrative Templates -> System -> Credentials Delegation -> Allow Delegating Fresh Credentials  
Verify that it is enabled and configured with an SPN appropriate for the target computer (WSMAN/myserver.domain.com or WSMAN/\*.\*.domain.com)  
May have to similarly enable "Allow Fresh Credentials with NTLM-only Server Authentication" if the above setting does not work
- `Enable-WSmanCredSSP -Role Client -DelegateComputer <remote server name>`

## • On the server machine

- `Enable-WSmanCredSSP -Role Server`

## Running Remote Commands

```
1 $server = "<server name>"
2 $cred = Get-Credential "<domain>\<user>"
3 $session = New-PSSession -ComputerName $server `
4   -Authentication CredSSP -Credential $cred
5 Enter-PSSession -Session $session
```

```
1 $server = "<server name>"
2 $cred = Get-Credential "<domain>\<user>"
3 $session = New-PSSession -ComputerName $server `
4   -Authentication CredSSP -Credential $cred
5 Invoke-Command -Session $session `
6   -ScriptBlock {Add-PsSnapin Microsoft.SharePoint.PowerShell}
7 Import-PSSession $session -CommandType Cmdlet `
8   -WarningAction SilentlyContinue
```

```
$server = "sp2010"
```

```
$cred = Get-Credential aptillon\spadmin
```

```
$session = New-PSSession -ComputerName $server -Authentication CredSSP -
Credential $cred
```

This:

```
Enter-PSSession -Session $session
```

Or this:

```
Invoke-Command -Session $session -ScriptBlock {Add-PsSnapin
Microsoft.SharePoint.PowerShell}
```

```
Import-PSSession $session -CommandType Cmdlet -WarningAction SilentlyContinue
```
